

AgencyOS Full Journey Walkthrough

A time-based story showing every coordinator and specialist activated across one common request.

Scenario

Maya owns a small specialty coffee roaster. She asks AgencyOS to launch an office coffee subscription for local companies in 12 weeks. The work must move from research to build, marketing, operations, governance, launch, measurement, and learning.

Test User

What this PDF shows

The same request travels through AgencyOS over time. Every coordinator routes work. Every specialist produces a named artifact. Governance and Truth Agent prevent unsupported closeout. Maya receives decisions, assets, evidence, and next steps.

The Cast

Every coordinator and specialist appears in the 12-week journey.

The Time Lens

A 12-week route that activates the full AgencyOS network without forcing fake work.

Compelling story

Maya never has to manually manage 30 agents. She makes the key decisions. AgencyOS routes the work, asks for approval at the right moments, and returns evidence-backed deliverables over time.

Day 0 - The Request Enters AgencyOS

The user starts with one normal request. AgencyOS turns it into a governed work packet.

Week 1 - Research Becomes Direction

Research Coordinator routes facts, buyer context, ideas, and reusable knowledge.

Maya receives

A clear buyer hypothesis: office managers at 20-100 person companies want reliable local coffee without managing ad hoc orders. She also receives assumptions, proof gaps, and language customers already use.

Weeks 2-3 - Direction Becomes A Usable System

Engineering Coordinator turns the research into intake, workflow, automations, and tested assets.

Engineering Coordinator

Routes structure, design, implementation, and testing.

Architect

subscription workflow, operating map, dependencies

UX Designer

buyer intake form, review checklist, friction notes

Code Developer

lead tracker, reorder calculator, automation draft

QA / Testing

test results, defects, pass/fail notes

Truth Agent

artifact check, claim-to-evidence, closure status

Maya receives

A usable subscription workflow: intake form, approval checklist, lead tracker, pilot runbook draft, tested calculations, and verified artifact existence before the build lane closes.

Weeks 4-5 - The Offer Becomes Buyable

Growth Coordinator routes positioning, copy, sales assets, and community feedback.

Growth Coordinator

Names audience, channel, claims needing proof, and review route.

Marketing Strategy

positioning brief, channel strategy, campaign angle

Content Creation

landing copy, emails, posts, training docs

Sales Enablement

discovery questions, objection handling, follow-up sequence

Community Manager

reply drafts, feedback notes, question list

Maya receives

A clear offer, landing page copy, outreach sequence, sales call script, objection handling, and approved community reply drafts. Anything public waits for human approval.

Week 6 - Launch Gets Operational

Operations Coordinator ensures the subscription can actually run after the sale.

Operations Coordinator

Routes timing, ownership, tools, data, security, and operating cadence.

DevOps

runbook, environment notes, automation health check

Data Pipeline

field map, data quality notes, reporting input

Security

access review, sensitive data handling, risk recommendations

Performance Optimization

bottleneck analysis, throughput checklist

Maya receives

A launch runbook, data fields, access rules, privacy handling notes, delivery cadence, and a bottleneck plan for roasting, packing, routing, and customer updates.

Week 7 - Governance Protects Trust

Governance checks the work before the public pilot starts.

Policy

checks refund terms, subscription rules, privacy language

Risk Assessment

maps delivery, pricing, reputation, and fulfillment risks

Ethics Review

reviews claims, consent, customer impact, and transparency

Audit

checks evidence, ownership, completeness, and closeout readiness

Maya's approval gate

Maya approves the public offer, refund terms, customer data handling, claims, pricing assumptions, and pilot limits. AgencyOS can recommend. Maya authorizes.

Weeks 8-12 - Launch Learns

Insights Coordinator turns pilot activity into learning, decisions, and next moves.

Insights Coordinator

Routes measurement, customer signal, experiments, and strategic review.

Analytics

metric table, baseline comparison, measurement gaps

Experimentation

test plan, hypotheses, variants, success metric

Customer Insight

feedback themes, objections, language patterns

Strategy Advisor

decision brief, tradeoff map, next strategic move

Maya receives

A pilot scorecard, customer themes, test recommendations, a strategic next-move memo, and a learning packet returned to Knowledge Librarian for reuse.

Deliverables And User Relationship

Every artifact connects back to something the user can decide, use, review, or remember.

Deliverable	How it relates to Maya
Route + scope packet	Shows Maya what will happen and what remains her decision.
Research brief	Turns market uncertainty into a first buyer hypothesis.
Workflow + intake form	Makes the subscription operational instead of abstract.
Sales assets	Gives Maya messages, questions, and follow-up she can review.
Launch runbook	Shows who does what, when, and with what tools.
Governance packet	Protects claims, customer data, pricing, and approval boundaries.
Pilot scorecard	Shows what worked and what needs to change.
Closeout + memory update	Preserves the lesson so the next launch starts smarter.

Story close

Maya starts with one request. Over 12 weeks, every AgencyOS coordinator and specialist contributes exactly once or at the right recurring point. The work closes only when Truth Agent verifies the artifacts and Audit confirms the evidence trail.
